Project Number: JHB221625
Test Dates: September 15-16, 2021
Report Issued: November 15, 2021

EXECUTIVE SUMMARY

J.H. Baxter & Co. contracted Bison Engineering, Inc. to perform emissions testing at their facility in Eugene, Oregon. Testing was performed pursuant to the letter sent to J.H. Baxter & Co. by the Lane Regional Air Protection Agency (LRAPA) on January 7, 2021. This test campaign included ammonia emissions testing on the ammoniacal copper zinc arsenate (ACZA) scrubber and modified Method 204 tests to evaluate the draw from the tank vents into the vapor phase carbon (VPC) ventilation system. Emissions testing on the VPC unit and pentachlorophenol (PCP) stack will occur during a separate deployment.

This report presents emissions test data, describes the methods employed and details the quality assurance measures taken to ensure accurate data. Table 1 summarizes the ACZA scrubber test results. Detailed emission test results and further discussion of directional flow evaluations are included in Section 3.0 of this report.

Table 1: ACZA Scrubber Results Summary

J.H. Baxter & Co. ACZA Scrubber Emissions Test Results Summary September 15-16, 2021				
Parameter	Units	Run 1*	Run 2	Average
Ammonia	average ppmvw	6,849	3,215	5,032
	average lb/hr	0.17	0.74	0.46
	total lb emitted over	1.24	4.02	2.63
	lb/ft ³ of treated	0.00323	0.01047	0.00685
	lb/gal of treating	0.00284	0.01344	0.00814

ppmvw – parts per million by volume on a wet basis

lb/hr – pounds per hour

lb- pounds

lb/ft³ of treated wood – pounds per cubic foot of treated wood produced

lb/gal of treating solution – pounds per gallon of treating solution used

*- run 1 does not include data from the crack-and-vac and fumes process step, further explanation can be found in section 3.1 of this report.

During evaluations of flow from the tanks to the VPC ventilation system, Bison observed definitive inward direction of flow at tanks 3, 4 and both retorts tested. Inconclusive direction of flow was observed at tanks 2, 7, 26 and 27. Situational circumstances and hazards made collecting conclusive data difficult.

REVIEW AND CERTIFICATION

All work, calculations, other activities, and tasks performed and documented in this report were carried out under my direction and supervision. This test project conforms to the requirements of Bison Engineering, Inc.'s quality manual and American Society for Testing and Materials (ASTM) D7036-04.

Project Manager: Zach Harding

Title: Source Director

1.0 INTRODUCTION

1.1 Project Summary and Objectives

J.H. Baxter & Co. (J.H. Baxter) retained Bison Engineering, Inc. (Bison) to perform emissions testing at their wood preservation facility in Eugene, Oregon. Bison submitted a pre-test protocol to the Lane Regional Air Protection Agency (LRAPA) on September 8, 2021. In a letter sent to J.H. Baxter on January 7, 2021, LRAPA requested emissions testing on three of the facility's emission units: the vapor phase carbon (VPC) unit while using the creosote preservative solution, the pentachlorophenol (PCP) stack, and the ammoniacal copper zinc arsenate (ACZA) scrubber exhaust. This facility is subject to the provisions of LRAPA Standard Air Contaminant Discharge Permit (ACDP) number 200502. Results of emissions testing presented in this report will support the development of J.H. Baxter's Cleaner Air Oregon (CAO) emissions inventory.

During this testing deployment, Bison conducted emissions testing on the ACZA scrubber, and evaluations of directional flow on the VPC ventilation system and retorts 81 and 84 during the "crack and vac" process. Emissions testing on the VPC unit and PCP stack will occur during a second test campaign.

Bison employed U.S. Environmental Protection Agency (EPA) test methods as described in Title 40 Code of Federal Regulations (CFR) Part 60, Appendix A. Tables 2 and 3 summarize the test methods used during the test campaign.

Table 2: ACZA Scrubber Emission Test Matrix

J.H. Baxter & Co. ACZA Scrubber Emission Test Matrix September 15-16, 2021		
EPA Method	Parameter	Test Plan and Comments
1A	Sampling location and traverse points	One measurement prior to sampling.
320	Ammonia, moisture	Two, approximately 9-hour test runs.

Table 3: Verification of Directional Flow Test Matrix

1.3 Testing Personnel

The Bison on-site testing team was led by Zach Harding, Source Testing Director. He was assisted during field testing by Conor Fox, QI, Project Scientist. Mr. Harding served as project manager. Mr. Harding, Mr. Fox and Lynn Dunnington, Environmental Scientist, processed the test data. Ms. Dunnington authored this report. Mr. Harding performed a final quality assurance review of the data and test report.

Scott Thielke, Environmental and Safety Manager, was the primary contact for J.H. Baxter. Mr. Thielke was present on-site for most of the testing. J.H. Baxter staff members were responsible for monitoring process parameters during testing. Brian Snuffer Zukas of Maul Foster & Alongi compiled the process data and provided it to Bison for use in this report.

Katie Eagleson from LRAPA was present on-site during the test campaign.

2.0 SOURCE DESCRIPTION

2.1 Facility Description

J.H. Baxter owns and operates a wood preservation facility in Eugene, Oregon. The facility treats multiple commodities including poles, railroad ties, glued laminated timbers (i.e., glulams and powerlams), pilings, posts, original equipment manufacturer parts and components, and miscellaneous dimensional lumber products. The wood products are treated with water- or oil-based preservative solutions in a high pressure and high temperature environment. Oil-based preservative solutions currently used by the facility are PCP, creosote, and a 50/50 blend of creosote and Bunker C oil (50/50). The only water-based preservative currently used at the facility is ACZA, trade name “Chemonite”.

2.2 Emission Source Description

2.2.1 VPC Ventilation System and Retorts

Untreated commodities are packed into bundles on a tram. The bundle configurations vary depending on the commodity type and which wood treating vessel (referred to as a “retort”) is used. Each retort has a unique identification number and utilizes the treatment solution(s) as follows:

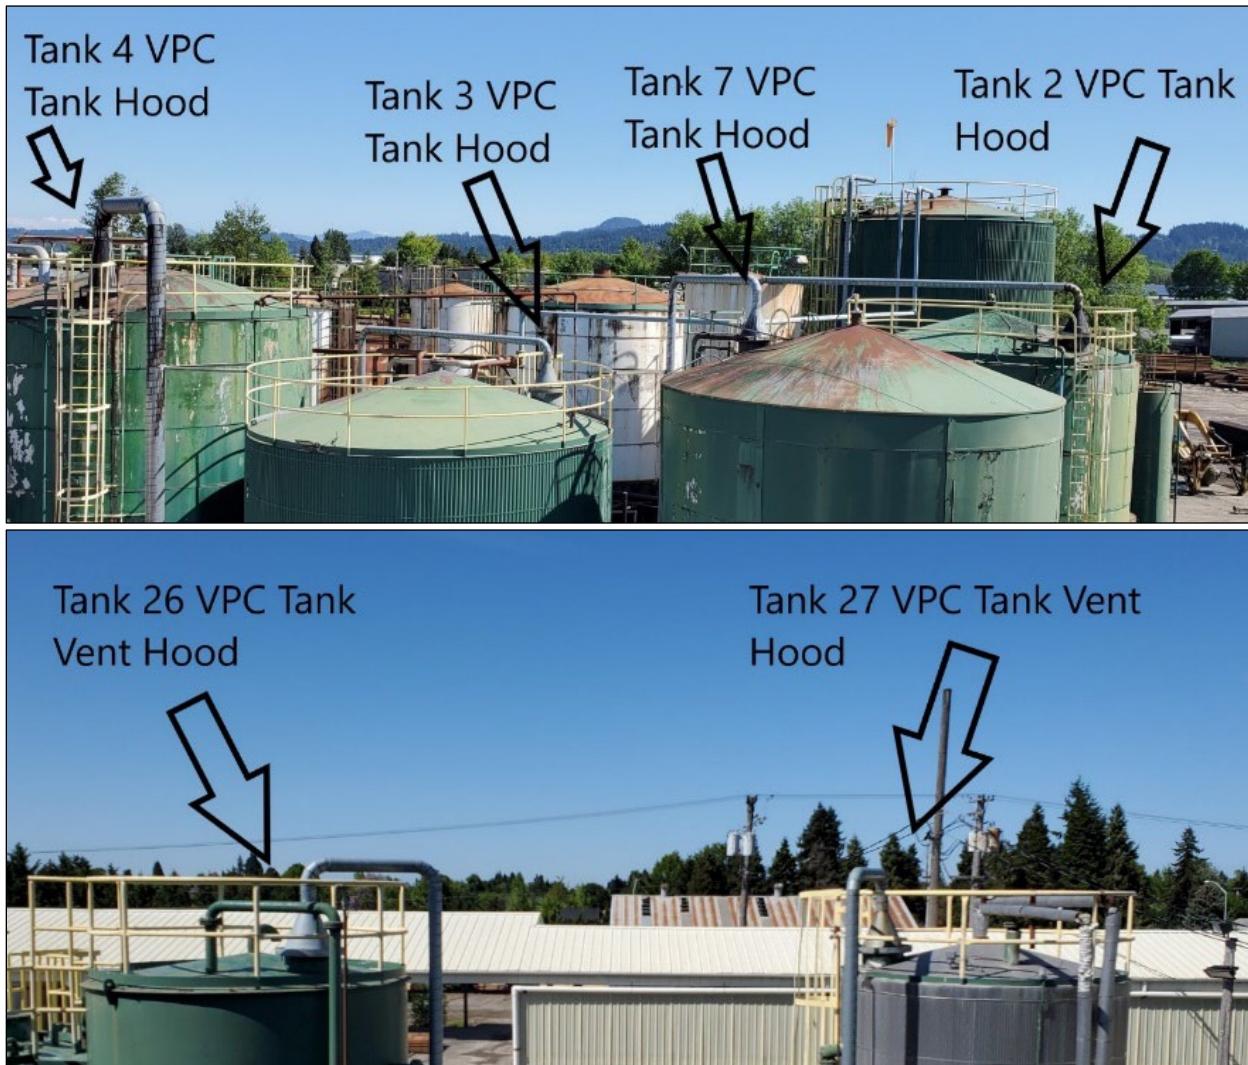

- Retort 81: Creosote, 50/50, or PCP
- Retort 82: ACZA or PCP
- Retort 83: Creosote or 50/50
- Retort 84: ACZA
- Retort 85: PCP

Vapors generated during the wood conditioning process are routed to a condenser. The condenser removes liquid from the exhaust stream. Liquids removed by the condenser are routed to a hot well (i.e., sealed vessel) prior to flowing, via gravity, to a downstream collection sump. An open top catch basin is located directly below the hot well for maintenance purposes only. Process liquids collected in the sump are delivered to a recovery tank prior to entering the process water treatment system. The dried exhaust stream is routed to a knock-out drum prior to exhausting to atmosphere through the PCP stack. The dried exhaust stream during heavy oil (i.e., creosote or 50/50) charges is routed to a downstream VPC ventilation system for control of VOC emissions prior to emitting to atmosphere.

Once the final vacuum is released, the retort doors are cracked open and the vacuum pump is restarted. The vacuum pump pulls in fresh air allowing for the charge to cool inside the retort. This process is referred to as the “crack-and-vac” cycle. The volume of air displaced by the vacuum pump is routed to the downstream condenser, similar to the conditioning process described above.

The vent hoods of tanks 2, 3, 4, 7, 26 and 27 are also connected to the VPC ventilation system. Figure 1 shows the locations of the vent hoods.

Figure 1: VPC Tank Vent Hoods

2.2.2 ACZA Scrubber Stack

The ACZA scrubber is located in the north tank farm area. Dried exhausts from the condensers connected to Retorts 82 and 84 are routed to the ACZA scrubber and associated stack prior to release to atmosphere. The ACZA scrubber stack is vertically-oriented with a circular diameter of 10.25 inches. The release height of the stack is approximately 29 feet above ground level and 50 inches above the top of the tank. A temporary stack extension was added by Bison and sampling ports were installed prior to the start of the test campaign. Sampling ports were accessed via the top of the scrubber tank. While on-site, Bison verified the sampling locations meet EPA Method 1A specifications; detailed Method 1A information is included in the appendices to this report. A photo of the stack and scrubber tank is provided in Figure 2.

Figure 2: ACZA Scrubber Stack and Sampling Location

3.0 EMISSION TEST RESULTS

3.1 Summary of Emissions Test Results

The table below summarizes the ACZA scrubber test results. During periods that the retort was closed, Bison was unable to perform flow measurements at the ACZA scrubber outlet because actual flow was either very intermittent or non-existent at the outlet. To determine mass rates of ammonia during these periods, Bison used the volume of the entire retort less the volume of wood, every time the retort would have been evacuated or filled, causing the displacement of vapors. Additional supporting material, including raw data, plant data, example calculations and calibration records, can be found in the appendices to this report. Flow measurements taken during crack-and-vac and fumes step were used to determine mass emissions during that process step for Run 2. Due to a miscommunication Bison did not capture the crack-and-vac and fumes process step for Run 1.

Table 3: ACZA Scrubber Test Results

J.H. Baxter & Co. ACZA Scrubber Exhaust Ammonia Emissions Test Results September 15-16, 2021				
Parameter	Units	Run 1*	Run 2	Average
Treatment Cycle Start Time		04:00	06:00	
Treatment Cycle End Time		20:55	17:10	
Treatment Cycle Duration	hh:mm	16:55	11:10	
Sampling Duration ¹	hh:mm	9:15	9:30	
Retort Void Space	ft ³	1,023	1,023	1,023
Wood Treated	ft ³	384	384	384
Treating Solution Used	gal	436	299	367.50
Ammonia	average ppmvw over treatment cycle	6,849	3,215	5,032
	lb over treatment cycle	1.24	4.02	2.63
	lb/ft ³ of treated wood	0.00323	0.01047	0.00685
	lb/gal of treating solution	0.00284	0.01344	0.00814

¹sampling duration is less than treatment cycle duration to reduce sampling time to coincide with cycle steps when vapors from the retort are potentially released.

²Run 1 does not include the crack-and-vac/fumes process step

hh:mm- hours: minutes

gal- gallons

ft³- cubic feet

3.2 Summary of Modified Evaluation of Directional Flow

Bison followed an abbreviated version of EPA Method 204 in an attempt to validate the directional flow from the tank vents to the VPC ventilation system. Since there was not a true enclosure (e.g., a building) to test, Bison used direction of air flow and visual inspection of the vacuum systems, capture hoods and associated ductwork to evaluate each location.

Visual inspection was used to identify any NDOs. Direction of air flow was monitored by placing a smoke emitter at each NDO to show the direction of air flow. Smoke tests were documented through photographs or video.

3.2.1 Flow Direction Evaluation at VPC Tank Vent Hoods

Bison performed this modified Method 204 at six VPC tank vent hoods. The vent hoods tested were associated with tanks 2, 3, 4, 7, 26 and 27. The NDOs at each hood are simply the gap between the tank vent outlet and the overarching hood and ductwork. It was not possible to accurately measure the area of these NDOs. Bison placed a smoke emitter at each vent-hood NDO and captured a picture every 10 minutes for one hour. A montage of these photographs is presented in Appendix B to this report.

Bison observed definitive inward direction of flow at tanks 3 and 4. The smoke tests at tanks 2, 7, 26 and 27 were inconclusive. Bison feels that performance of modified Method 204 did not yield results sufficient to confirm or deny whether any flow from these VPC tank vent hoods was not captured by the VPC ventilation system because the test method is not designed for this purpose (i.e., it is designed for evaluating buildings). Visual inspection of the VPC ventilation system ductwork showed no unexpected NDOs.

3.2.2 Flow Direction Evaluation at Retorts

Bison performed modified Method 204 at Retorts 81 and 84 during the “crack-and-vac” cycle. Bison identified the gap between the door and the retort body (when the door is cracked open) as the only NDO at each retort door. It was not possible to obtain an accurate measurement of the NDO area at either retort. Bison placed a smoke emitter at various locations near each NDO and captured video documentation. The smoke test was performed twice at each retort. The first test at each retort was performed on day one of testing. The second test was performed the following day. A montage of still frames derived from the video documentation illustrates these phenomena and is included in Appendix B to this report. The videos will be provided to LRAPA for review.

Bison observed definitive inward direction of flow at both Retort 81 and Retort 84 once the vacuum pump was turned on and when the smoke emitter was held in close proximity to the NDOs. Igniting a smoke emitter while near the cracked retort was a safety concern because of the possibility of inadvertently igniting flammable vapors inside the retort. The smoke test at each retort revealed a short period following the opening of the retort door during which air flow was not definitively inward. Once the vacuum pump was fully engaged, direction of flow became definitively inward. Bison feels that performance of modified Method 204 did not yield results sufficient to confirm or deny whether any flow from either retort might exit the door because the test method is not designed for this purpose (i.e., it is designed for evaluating buildings).

3.3 Operating Conditions

Representatives of J.H. Baxter recorded details of plant operations during testing. Maul Foster and Alongi personnel compiled the raw process data and provided it to Bison for use in this report. Process data is presented in the report appendices.

3.4 Field Observations

Testing was performed as outlined in the test protocol dated September 8, 2021. No adverse or unusual environmental conditions were noted that are known to have influenced the outcome of these tests. The ACZA scrubber does not have an induced draft fan and therefore does not have consistent flow rate. Bison was unable to perform flow measurements at the ACZA scrubber outlet during all process steps except crack-and-vac and fumes because actual flow was either very intermittent or non-existent at the outlet. To determine mass emission rates of ammonia during process steps other than crack-and-vac and fumes, Bison used the volume of the entire retort less the volume of wood, every time the retort would have been evacuated or filled causing the displacement of vapors. Sampling time for ammonia concentrations during run 2, step 2 does not match production data run times. Bison run time ended at 9:00 am but production data states step 2 lasted until 9:30. Bison does not feel this has significant impact on results because flow rates were determined assuming the entire retort volume was evacuated during step 2. To determine mass emission rates of ammonia during the crack-and-vac and fumes process step, Bison used the flow rate measured during that time. As previously stated, due to a miscommunication Bison does not have ammonia concentration or flow rates during the crack-and-vac and fumes process step for Run 1.

4.0 EMISSION TEST METHODS AND PROCEDURES

4.1 Testing Methods and Procedures

Bison testing personnel performed the following EPA methods as described in 40 CFR 60, Appendix A.

EPA Reference Method 1A, "Sample and Velocity Traverses for Stationary Sources with Small Stacks or Ducts." The objective of Method 1A is to determine a suitable location for testing and to determine the velocity and/or sample points for the source when the stack/duct is less than 12 but greater than four inches in diameter.

EPA Reference Method 2C, "Determination of Stack Gas Velocity and Volumetric Flow Rate in Small Stacks or Ducts (Standard Pitot Tube)." The objective of Method 2 is to determine volumetric flow in a source when the stack/duct is less than 12 inches in diameter but greater than 4 inches. The average velocity, temperature, static pressure, and source area are used to calculate volumetric flow for the source.

EPA Reference Method 204, “Criteria for and Verification of a Permanent or Temporary Total Enclosure.” The objective of Method 204 is to determine whether a permanent or temporary enclosure meets the criteria for being considered a total enclosure. If all the criteria are met, then the VOC capture efficiency is assumed to be 100 percent. For this test an abbreviated methodology was used requiring only visual inspection and demonstration of air flow direction.

EPA Reference Method 320, “Measurement of Vapor Phase Organic and Inorganic Emissions by Extractive Fourier Transform Infrared (FTIR) Spectroscopy.” The objective of Method 320 is to determine the concentrations of vapor phase organic or inorganic compounds, including hazardous air pollutants (HAPs) for which EPA reference spectra have been developed. Ammonia calibration gas will be used for spiking. Dynamic spiking using water or carbon dioxide as a surrogate tracer will be used in lieu of sulfur hexafluoride (SF₆).

4.2 Sample Handling and Analytical Procedures

No physical samples requiring off-site processing were generating during this test campaign. All analytical procedures complied with EPA methodology.

Stack Absolute Temperature

$$T_m = T_s + 460 \quad 540 \text{ } ^\circ\text{R}$$

Where: $T_s = 80$

T_s stack temperature, $^\circ\text{F}$
 T_m absolute temperature, $^\circ\text{R}$

Stack Absolute Pressure

$$P_s = P_{bar} + (P_g / 13.6) \quad 29.510 \text{ "Hg}$$

Where: $P_{bar} = 29.51$
 $P_g = 0$

P_{bar} barometric pressure, "Hg
 P_g stack static pressure, " H_2O
13.6 Hg molecular weight relative to water molecular weight

Velocity

$$V_s = K_p C_p [\text{avg.} \sqrt{(D_p)}] [\sqrt{(T_s/P_s M_s)}] \quad 9.07 \text{ fps}$$

Where: $K_p = 85.49$
 $C_p = 0.99$
 $\text{Avg.} \sqrt{D_p} = 0.135$
 $T_s = 540$
 $P_s = 29.51$
 $M_s = 29$

V_s	velocity, ft/sec	P_s	stack pressure, inHg
K_p	pitot tube constant	M_s	stack molecular weight, lb/lb.mole
C_p	pitot tube coefficient	D_p	delta pressure
T_s	stack temperature, degrees Rankin		

Actual Flow $Q = 60 V_s A \quad 311.8 \text{ acfm}$

Where: $A = 0.573$
 $V_s = 9.07$

Q	flow, acfm	60	minutes per hour
acfm	actual cubic feet per minute	V_s	velocity, ft/sec
Bws	source moisture percentage	A	area square feet, sqft

EPA Method 2
Example Calculations

Client: JH Baxter
Location: Eugene, OR
Standard Flow

$$Q_{std} = Q (1-Bws) * (T_{std}/T_s) * (P_s/P_{std}) \quad 293.57 \text{ dscfm}$$

Where:

Q=	312
Bws=	2.38%
Ts=	540
Ps=	29.51

Q	flow, acfm
Bws	source moisture percentage
Tstd	standard absolute temperature, 528 degrees Rankin
Ps	absolute stack pressure, inHg
Ts	absolute stack temperature, degrees R
Pstd	standard barometric pressure, 29.92 inHg

APPENDIX B: DIRECTIONAL FLOW VERIFICATION DATA

Bison Engineering, Inc.
EPA Method 204
Documentation of Air Flow Direction

Client: J.H. Baxter & Co.
Location: Eugene, OR
Dates: 9/15/21 and 9/16/21

The photo montages below document direction of air flow at each of six tank vent hoods and two retort doors.

The images at the retort doors were derived from short videos. Bison chose several still images from each video as representations of the range of results from the smoke test during the crack-and-vac cycle. The images are presented in chronological order.

Accredited Air Emission Testing Body

A2LA has accredited

BISON ENGINEERING, INC.

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 15th day of January 2020.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 4675.01
Valid to November 30, 2021

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

BISON ENGINEERING

Method 2, Section 10.1.6.7.1 Standard Pitot Tube

Date: 9/10/2021
Pitot ID: STD-12

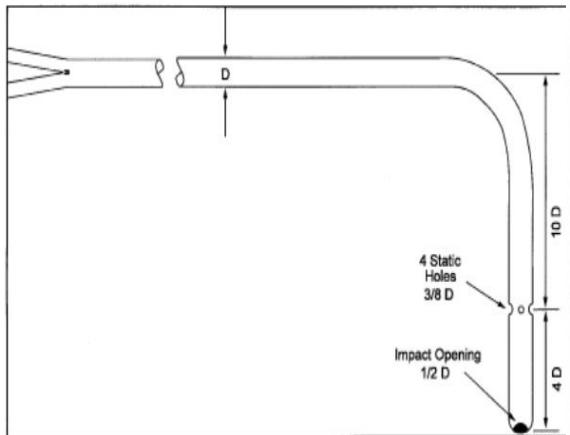

Figure 2C-1. Modified Hemispherical-Nosed Pitot Tube.

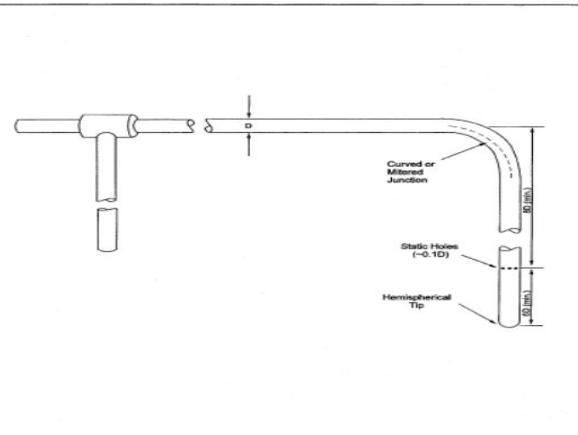

Figure 2-5. Standard pitot tube design specifications.

Are the static pressure holes free of any particulate that may block or obstruct negatives side pressure readings in any way?

Yes No

Do the openings still align within the specifications illustrated in Figure 2C-1 and 2-5 in accordance with section 6.7.1 below?

Yes No

Technician: ZDH Date: 9/10/2021

EPA Reference Method 2. Section 10.0 Calibration and Standardization

Method 2C - Determination of Gas Velocity and Volumetric Flow Rate in Small Stacks or Ducts (Standard Pitot Tube)

10.0 Standard Pitot Calibration and Standardization - Same as Method 2, Sections 10.2 through 10.4.

10.2 Standard Pitot Tube (if applicable). If a standard pitot tube is used for the velocity traverse, the tube shall be constructed according to the criteria of section 6.7 and shall be assigned a baseline coefficient value of 0.99.

If the standard pitot tube is used as part of an assembly, the tube shall be in an interference-free arrangement

6.7 Calibration pitot tube

A standard pitot tube designed according to the criteria given in sections 6.7.1 through 6.7.5 below and illustrated in Figure 2-5. Pitot tubes designed according to these specifications will have baseline coefficients of 0.99 ± 0.01 .

6.7.1 Standard Pitot Design.

6.7.1.1 Hemispherical (shown in Figure 2-5), ellipsoidal, or conical tip.

6.7.1.2 A minimum of six diameters straight run (based upon D , the external diameter of the tube) between the tip and the static pressure holes.

6.7.1.3 A minimum of eight diameters straight run between the static pressure holes and the centerline of the external tube, following the 90° bend.

6.7.1.4 Static pressure holes of equal size (approximately $0.1 D$), equally spaced in a piezometer ring configuration.

6.7.1.5 90° bend, with curved or mitered junction.

AIRDATA MULTIMETER CERTIFICATE OF RECALIBRATION

Customer ID: 022037 S/N: M16654
 Customer: BISON ENGINEERING, INC. City: HELENA State: MT
 As-Received Model #: ADM-850L Converted to Model #: Order #: R200125
 PO #: Customer Eqpt ID#: Calibration Due Date: 01/2022

This instrument has been calibrated using Calibration Standards which are traceable to NIST (National Institute of Standards and Technology). Test accuracy ratio is 4:1 for pressures and temperature. Quality Assurance Program and calibration procedures meet the requirements for ANSI/ANSI Z540-1, ISO 17025, MIL-STD 45662A and manufacturer's specifications. Calibration accuracy is certified when meters are used with properly functioning accessories only. All Uncertainties are expressed in expanded terms (twice the calculated uncertainty). This report shall not be reproduced, except in full, without the written approval of Shortridge Instruments, Inc. Results relate only to the item calibrated. For limitations on use, see Shortridge Instruments, Inc. Instruction Manual for the use of AirData Multimeters. Procedure used: Procedure for Differential Pressure, Absolute Pressure and Temperature Recalibration of AirData Multimeters SIP-CP02 Revision: 30 Dated: 04/04/16

NOTES:

Calibration standards used by Shortridge Instruments, Inc. are traceable to NIST (National Institute of Standards and Technology). Calibration is performed in accordance with ANSI/NCSL Z540-1, ISO 17025, MIL-STD 45662A and manufacturer's specifications. Calibration accuracy is certified when meters are used with properly functioning accessories only. This report shall not be reproduced, except in full, without the written approval of Shortridge Instruments, Inc. Results relate only to the item calibrated. Limitations on use: See Shortridge Instruments, Inc. Instruction Manual for the use of AirData Multimeters.

The enclosed ADM or HDM Calibration Standards form(s) is/are an integral part of this calibration and must remain with this Certificate of Calibration. Note: There may be more than one such form included that pertains to this calibration.
